

## **Question for IFB #2015-05 Batteries and Chargers**

**Question:** Is there any way we could get the max DC amp output needed for different chargers?

**Answer:** The specs written for these chargers are general specs. We will not be as low as 400 amps. Our minimum battery is 750 Amp hours. 1250 was a standard max based on the equipment we already have. We don't need the max lower than 1250, we can allow it to be higher.

**Question:** What types of connectors are on the batteries and charges?

**Answer:** 350 amp gray connectors for 36 Volts and 350 amp red connectors for 24 Volts
